

PEDRO BARBOSA

Platform / Support Engineer — Go, AWS, Kubernetes, Incident Response

Brazil (UTC-3) · Remote · barbosamaverickv8@gmail.com · github.com/Amadeus-22 · amadeus-22.github.io/portfolio
Portuguese (native) · English (fluent) · German (basic)

SUMMARY

Engineer who builds and operates production systems end to end, with Go as my language of choice for platform tooling. I provision and operate Linux workloads on AWS EC2 and work with Kubernetes. Day to day I own reliability work: CI pipelines, containerised builds, and incident response — reproduce the failure, read logs and system state, find the root cause, fix it, and leave a check so it cannot return silently. I care about automation that removes toil and failure modes that are visible instead of silent.

EXPERIENCE

Full Stack Developer — TIIX (remote)

April 2026 – present

- One of two engineers on a healthcare platform in production, used daily by patients, clinics and professionals, running on Linux with Apache.
- Incident response and root cause analysis: investigate application logs, database state and API responses, fix, and add a regression test — over a thousand written change records with cause, solution and evidence.
- Delivery through Git-based workflows with code review and CI pipelines; wrote 23 of the repository's 50 versioned database migrations and the largest share of its automated test suite.
- Integrations with external services and webhooks, with failure handling and reprocessing.

Software Engineer — QuantConnect (freelance, remote)

September 2025 – present

- Python batch workloads over years of time-series data, with deterministic, reproducible runs and live execution against broker APIs.

Python Developer — Freelance via Workana (remote)

January 2025 – March 2026

- Django system for a non-profit with role-based access control and privacy-compliant handling of personal data; data pipelines replacing manual spreadsheet processes.

Software Development Intern — TT&T Soluções em Informática (remote)

August 2024 – January 2025

- Django backend with payment gateway integration; MySQL modelling, pytest, optimisation of slow queries and HTTP requests.

SELECTED WORK

iode — open source daemon in Go, my own design: runs external tools as isolated subprocesses under a versioned contract, with bounded timeouts, process-group termination, filtered environment and validation of every response. Job queue with retry, backoff and orphan-job recovery; SQLite storage with numbered migrations. 5,100 lines of Go covered by 5,675 lines of tests, architecture decisions documented.

QuantStrata — Python risk engine shipped through a containerised pipeline (Docker, GitHub Actions) with 70 test cases, merged through formal code review.

Akaunting — merged fix to an open source accounting platform: database host and port not applied to the connection during install.

SKILLS

Languages: Go, Python, SQL, Bash, PHP, JavaScript

Cloud and containers: AWS EC2 (provisioning and operating Linux instances), Kubernetes, Docker

CI/CD and tooling: GitHub Actions, GitLab CI, Git, Linux, systemd, Apache

Reliability: incident response, root cause analysis, structured logging, timeouts, retries and backoff, process isolation

Databases: PostgreSQL, MySQL, SQLite — modelling, versioned migrations, query optimisation

Learning next: Terraform/Pulumi, EKS, Prometheus and Grafana

EDUCATION AND CERTIFICATIONS

Computer Engineering — Centro Universitário IBMR · 2023 – 2028 (expected) · GPA 8.7/10

HackerRank: Problem Solving (Intermediate), REST API (Intermediate) · Scientific initiation — IMPA, 2024
